

NEW REPAIR & SYSTEM TEST CAPABILITY

Schrader Bellows – Valvair II Pneumatic Valve

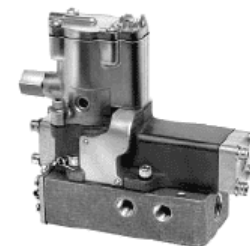

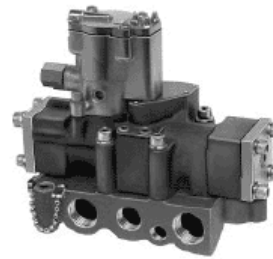

Technical Bulletin

K+S Services is pleased to announce their capability to repair the full line of Schrader Bellows Valvair II pneumatic directional control valves. The test system shown above is equipped with universal manifolds, an electronic “cyclic” control box and a test cylinder. The valves are mounted onto the test manifold where 120 psi of filtered & regulated air is applied. The control ports from the manifold are connected to the test cylinder and cycled via the electronic control system. Performance of both single and double solenoid actuated valves are tested and verified to meet OEM specifications. Below is a list of some of the most common series of Schrader Bellows valves testable by this system.
